

Connect Worldpay and take a live card payment

This guide connects your pharmacy's own Worldpay merchant account, switches new orders onto hosted checkout, and proves the connection with one small live payment.

Have these ready

- The Worldpay dashboard login for this pharmacy's merchant account.
- Someone who can open **Settings & Assets** in Holistic Health Hub.
- Your Worldpay Implementation Manager's contact, for the payment-update address.
- One small real order you are willing to pay and then refund.

You will copy three values

1. Entity, which starts with PO
2. Live API username
3. Live API password

Nothing else from the Worldpay dashboard is entered into Holistic Health Hub.

Card numbers are typed on Worldpay's page, not into Holistic Health Hub. The money settles to this pharmacy's Worldpay account. 3 October 2026.

1. What you are setting up

Each pharmacy has its own Worldpay account. Holistic Health Hub uses that account to open a hosted payment page for an order. The patient pays Worldpay. Holistic Health Hub then checks the payment with Worldpay before the order can show as paid.

Until this connection is verified, new orders stay on **Pharmacy payment**: EPOS, cash, or bank transfer. Worldpay hosted checkout stays locked.

Use the live API username and password. Not your dashboard login.

The username and password you type to open Worldpay will be refused. A single API key will be refused. The Checkout ID under Access Checkout is not used.

2. Copy these three values, and only these

The entity starts with **PO**. The same entity is used for Try and Live. The username and password are not the same in Try and Live. For a pharmacy taking real card payments, generate the **Live** pair.

3. In the Worldpay dashboard

- 1 Sign in to the Worldpay dashboard for this pharmacy.
Use the merchant account that will receive the card payments. Do not use a personal login from another business.
- 2 In the left menu, open **Developer Tools**.
- 3 Copy the **Entity** at the top of the page. It starts with PO.
In this guide the real value is hidden. Yours will be a PO number with a copy button beside it.
- 4 Open **API Credentials**.
- 5 Select **Live mode**, then generate the credentials and copy the username and password immediately. They are shown once. Generating another set does not switch off the previous set. If you miss them, generate again and use the new pair.

Developer Tools. The red outlines are on the menu item and on API Credentials. This picture is still on **Try mode**. Click **Live mode** before you generate credentials for a pharmacy that will take real payments. Leave Access Checkout and HPP Designer closed.

The picture above is the practice tab.

Try credentials connect, and Holistic Health Hub will label the connection **Try**. They cannot take a patient's real card payment. Live mode uses a different username and password. The entity stays the same.

4. Paste them into Holistic Health Hub

- 6 In the pharmacy workspace, open **Settings & Assets**.
- 7 On **Payment route**, paste the three values into **Connect this pharmacy's merchant account**.
- 8 Press **Show while entering** and check the password was pasted in full. It needs at least 8 characters.
- 9 Press **Save and verify connection**. Wait until it finishes. Do not paste the values a second time while it is checking.

Payment route Pharmacy payment

How new orders take payment. Each order permanently records the route selected when it was created.

Pharmacy payment
 EPOS, cash, bank transfer or another pharmacy-controlled route.

Worldpay hosted checkout
 Connect and verify the pharmacy merchant account below first.

Worldpay is optional. Connect the merchant here when you are ready.

Connect this pharmacy's merchant account
 Worldpay details are verified securely and are never displayed again after saving.

Worldpay username

Worldpay password

Merchant entity ID

☐ Show while entering

Settings & Assets, before a connection exists. **Worldpay hosted checkout** is locked until verification succeeds. Pharmacy payment stays selected, which is correct at this point.

The password is not shown again after a successful save.

To replace it later, use **Rotate credentials** on the same card. **Remove connection** stops new orders from using Worldpay. An order already sent for payment is not cancelled by removing the connection.

5. What a successful connection looks like

ILLUSTRATION OF THE SCREEN AFTER VERIFICATION. YOUR DATE AND MASKED ENTITY WILL DIFFER.

Payment route Worldpay

How new orders take payment.

Pharmacy payment
 EPOS, cash, bank transfer, or another pharmacy-controlled route.

Worldpay hosted checkout
 Verified merchant connection. Settlement goes directly to this pharmacy.

ENVIRONMENT	LAST VERIFIED	MERCHANT ENTITY
Live	Today, after you save	PO....

The card also shows **Connected**, plus **Refresh status**, **Rotate credentials**, and **Remove connection**.

- Check **Environment** says **Live**.
If it says Try, you saved Try credentials. Generate the Live pair and use Rotate credentials.
- Select **Worldpay hosted checkout**.
That choice is the default for new orders. An order already created keeps the route it was given.

6. Ask Worldpay to send payment updates

Holistic Health Hub can check a payment itself, but the usual path is a webhook: Worldpay tells us a payment changed, and we then confirm the amount, currency, and entity with the username and password you saved. A webhook on its own never marks an order paid.

Ask your Worldpay Implementation Manager to register this address for the pharmacy's merchant account:

```
https://europe-west2-hhh26-4ebd2.cloudfunctions.net/apiLondon/v1/public/payments/worldpay/webhook
```

Ask them to turn on these events. Then open **Developer Tools → Webhooks** and confirm the same events are enabled.

sentForSettlement

settlementFailed

sentForRefund

refunded

refundFailed

You do not put this address into Holistic Health Hub.

It is registered on the Worldpay side. If you cannot see Webhooks in the dashboard, the Implementation Manager still needs to register the address. Do not invent a different URL.

7. Prove it with one small live payment

Use a real order for a small amount you can refund afterwards. Do not type a card number into Holistic Health Hub.

1 • ORDER

Create the order in the usual way. On the payment step, choose **Worldpay**.

2 • LINK

Press **Send payment link**. The secure link is copied. The patient pays on Worldpay's page.

3 • PAY

Complete that one payment. You should see Worldpay's own card page, with no card fields inside Holistic Health Hub.

4 • PAID

Return to the order. It should show **Paid** once Worldpay has confirmed it. Then refund that test payment in the normal way.

Stop if the order does not show Paid.

Do not send a second payment link for the same order until you know the first payment failed or was cancelled in Worldpay. Taking a second card payment can charge the patient twice.

If the order stays waiting, open **Settings & Assets** and press **Refresh status**. A successful connection can still be waiting on the webhook from section 6. The order is paid only after Holistic Health Hub has checked the payment with Worldpay.

8. If it does not verify

WHAT YOU SEE	WHAT TO DO
Worldpay did not authorise this username and password.	You pasted the dashboard login, an API key, or a username from the wrong mode. Go back to Developer Tools, open Live mode , and copy the API username and password again, with the PO entity from the same page.
The password needs at least 8 characters.	The paste was cut short. Show the password while entering and paste it again.
Environment says Try.	Try credentials were saved. Generate Live credentials and use Rotate credentials .
Worldpay hosted checkout stays locked.	Verification has not succeeded yet. The form in section 4 is still the right place. Pharmacy payment remains the route until it does.
The connection verified, but the test order never shows Paid.	Confirm the webhook address and the five events in section 6. Refresh the order once. Do not create a second card payment for that order.

9. Tick this before you call it live

- ☐ Entity, live username, and live password were copied from Developer Tools. The dashboard login was not used.
- ☐ Save and verify connection succeeded.
- ☐ Environment says Live, and the merchant entity is masked on screen.
- ☐ Worldpay hosted checkout is selected on Payment route.
- ☐ The Implementation Manager has registered the webhook address, and the five events are on.
- ☐ One small live payment shows Paid on the order.
- ☐ That test payment has been refunded.

Leave these alone

- Access Checkout and its Checkout ID
- HPP Designer, unless you are only changing how the payment page looks
- Any API key that is not a username and password pair
- Another pharmacy's entity or credentials
